

Application Notes

VIBRATION SENSOR

Save battery power in handheld devices with SoLiCo's new **VIBRATION SENSOR**

SoLiCo recently designed a vibration sensor for an OEM manufacturer of universal remotes. The customer found that when they used the vibration sensor they were able to increase the battery life from 1 year to almost 4 years. When the remote control is not being used it goes into a "sleep mode" and the vibration sensor will sense any movement of the remote, turning the remote back on. The customer found the vibration sensor to be an effective/inexpensive solution to the customer's problem.
